Server Address

To configure the server address that LAPIS will use when generating links in the emails it sends do the following:

- Open ~/apache-tomcat/production-cofig.json file in your favorite text editor
- Edit or add the following property:

```
"serverAddress": "http://localhost",
```

Change "http://localhost" with your LAPIS server address, for example "https://lapis.example.com"

Restart tomcat to apply the changes:

`sudo systemctl restart tomcat.service`
