

Server Address

To configure the server address that LAPIS will use when generating links in the emails it sends do the following:

- Open `~/apache-tomcat/production-cofig.json` file in your favorite text editor
- Edit or add the following property:

```
"serverAddress": "http://localhost",
```

Change `"http://localhost"` with your LAPIS server address, for example `"https://lapis.example.com"`

Restart tomcat to apply the changes:

```
sudo systemctl restart tomcat.service
```
